

We've taken some military maps from Wikimedia Commons to produce a [KML layer](#). A KML file is a file that contains geographic annotation and visualisation for earth viewing software. Within the map are 4 layers - some of which might obscure other layers, and so you can turn these off and on, or, in Google Earth, scale a layer's opacity.

- [Open the map in Google Maps](#)
- [Download the KML layer](#) and open in Google Earth

Instructions for opening in Google Earth: If you haven't already, download [Google Earth](#) to your computer, and open the KML file. You can use your cursor to move around the globe and in many cases zoom down to street level.
